Contents of the thesis

PREFACE:

CHAPTER 1: General introduction: nanoparticles, synthesis by pulsed laser ablation,
and generation dynamics

- I. Gold (Au) nanomaterials and their generations by pulsed laser irradiations
- II. Silicon (Si) nanomaterials and their generations by pulsed laser irradiations
- III. Laser ablation in supercritical fluid for generating advanced nanomaterials
- IV. Motivation of this dissertation
 - A) The dynamics of gold nanoparticle generation in supercritical fluid:
time evolutions from nanosecond to hours
 - B) Generation and luminescence mechanism of light-emitting Si nanocrystals by laser ablation

References

CHAPTER 2: *In situ* multipurpose time-resolved spectrometer and the dynamics
of gold nanoparticle generation in supercritical fluid

- I. Introduction
- II. Development of Apparatus
 - A. Optical cell designed for *in situ* spectroscopic measurements of nanoparticle
generation by pulsed-laser ablation in supercritical fluid
 - B. *In situ* transient absorption spectrometer for observing nanoparticle
generation in supercritical fluid
 - C. *In situ* time-resolved absorption spectrometer for observing nanoparticles
in supercritical fluid at long delay times

D. *In situ* time-resolved dynamic light scattering for tracking nanoparticle size in supercritical fluid

III. Summary

IV. Acknowledgments

References

CHAPTER 3: Spectroscopic time evolution of the white-light-emission from silicon nanocrystal and the investigation of its mechanism

I. Introduction

II. Experimental Section

III. Results and Discussion

IV. Conclusions

V. Acknowledgments

References

CHAPTER 4: Summary

APPENDIX I: The basics of Mie theory

APPENDIX II: Electronic band structures and photo-luminescence mechanisms of Si nanocrystal

APPENDIX III: The design drawings of the high-pressure optical cell

ACKNOWLEDGMENTS
